

TalentHub — Final Presentation Handoff

For: Designer (slide build) + Presenter (5-minute speech) **Format:** 6 slides · ~5 minutes · max 4 screenshots **Context:** Presentation takes place **at the adidas center** — so we keep client background minimal and avoid re-explaining adidas to adidas.

How to use this document

Each slide block has three parts:

- **On slide** → what the designer puts on the slide (titles, bullets, tables, diagram).
- **You say** → compact speaker script (read/adapt naturally).
- **Screenshot** → where a screenshot goes (only 4 total).

Authoritative numbers come from the near-final LaTeX report. **Use these exact figures:**

Metric	Value
Database tables	33
API endpoints	66
Automated tests	305 (across 18 files)

SLIDE 1 — Title + value proposition (~25s)

On slide:

- Title: **TalentHub — Talent Intelligence & Language Verification Platform**
- One line: *AI-assisted screening + a persistent, verified talent pool for a multilingual workforce*
- Badge: **Live** · `adidas-pool.vercel.app`

You say:

"TalentHub is a working prototype that takes a recruiter from a pile of raw CVs to a ranked, language-verified shortlist — and keeps every candidate in a persistent, shared talent pool. Let me walk you through what it does and how it's built."

SLIDE 2 — Needs → What we delivered (~55s)

On slide: grouped 2-column table.

Recruitment need	What we built
Ingest at scale	Single + bulk ZIP CV upload, async parsing pipeline
Structure raw CVs	AI extraction → skills, CEFR languages , experience, education, 16 canonical <i>fields of work</i>

Recruitment need	What we built
Verify language objectively	AI interview scoring spoken English on the CEFR rubric
Rank fairly	Two transparent scores: Quality (CV-intrinsic) + per-job Fit (7 criteria)
Manage candidates	Status lifecycle, tags, recruiter notes, watchlist , per-job shortlists
Full audit trail	Per-candidate interaction history — every status change, email, campaign
Engage talent	Email contact, promo campaigns, notifications , candidate segments
Beyond hiring	Internship applications (motivation letter + learning agreement) & Ambassador program portal
Develop borderline talent	Improvement tracks auto-created on a failed assessment
Decide with data	Analytics dashboard — 7 default charts + a custom chart builder

You say:

"The core is parse, score, rank — but it goes much wider. HR gets full candidate lifecycle management: status tracking, notes, shortlists per job, a complete interaction audit trail, plus engagement tools like email, campaigns and notifications. And it's not only full-time hiring — there are dedicated flows for internships and a brand-ambassador program. Crucially, all of this data is shared across every HR user."

Must-say note: *transparent, deterministic scoring — not black-box AI; humans always decide.*

SLIDE 3 — App flow diagram (Candidate + HR + shared pool) (~70s) ★

On slide: render this diagram large — this is the slide you spend the most time on.

You say:

"Two sides feeding one shared pool. A candidate signs in, uploads a CV that AI parses into skills and CEFR languages, then applies — not just to jobs, but to internships and the ambassador program — and can take an AI interview. On the HR side, a recruiter posts a job, the system parses its requirements, and every candidate gets two scores: a Quality score that's CV-intrinsic, and a Fit score computed live against *that specific* job across seven criteria. HR ranks, shortlists, updates status, and

engages via campaigns and notifications. The key point: this pool and all candidate history is **transversal across every HR user** — one shared, consistent source of truth."

SLIDE 4 — The AI Interviewer (teammate's part) (~50s) 📸 Screenshot #1

On slide: interview screenshot · badges **Technical mode** · **Language** / **CEFR mode**.

You say:

"The standout — built by [teammate] — is the AI Interviewer, in two modes: a Technical mode that probes a chosen skill, and a Language mode that scores spoken English on the CEFR scale. Beyond verification, it plays three roles: it acts as an automated **first screening**, it hands HR **extra structured signal** they wouldn't get from a CV alone, and it's a way to **keep borderline candidates engaged** — a near-miss isn't rejected, it's routed into an improvement track. That last part is designed but not fully implemented yet."

SLIDE 5 — Tech stack + real scale (~45s) 📸 Screenshot #2 (HR ranking view)

On slide:

- **Frontend:** Next.js 16 · React 19 · shadcn/ui · Tailwind
- **Architecture:** Onion / Clean Architecture (TypeScript)
- **Data/Auth/Storage:** Supabase — PostgreSQL, Google OAuth
- **AI:** Groq (Llama 3.3 70B) primary · OpenAI GPT-4o fallback
- **AI Interview backend:** FastAPI (Python) + speech-to-text/TTS
- **Hosting:** Vercel
- **Scale chips:** 33 database tables · 66 API endpoints · 305 automated tests
- One line: *Provider-agnostic — matching core needs no LLM; AI flows can re-point to a self-hosted Llama with one adapter change.*

You say:

"It's a cloud-native stack — Next.js and Supabase on Vercel — built on Clean Architecture, so business logic never depends on the database or the AI provider; we actually swapped our entire database mid-project with minimal pain. Concretely: 33 tables, 66 API endpoints, and 305 automated tests running in CI on every push. And it's provider-agnostic — the matching core has no AI dependency at all, while the AI flows run on free-tier models today but can be re-pointed to a self-hosted Llama with a single adapter change. So this could run entirely inside adidas."

SLIDE 6 — vs State of the art → what adidas can adopt (~55s)

On slide: "Market gap → Our response" table.

Market gap	TalentHub's response
Matching is opaque / workflow-centric	Pure, unit-tested Fit function, per-criterion breakdown

Market gap	TalentHub's response
Language is self-declared	Dual-mode CEFR AI interview with sub-scores
Compliance bolted on afterwards	GDPR deletion-aware schema + full audit trail
LLM output unreliable for parsing	Strict tolerant validation + provider fallback
Intelligence tools assume big budgets	Free-tier / self-hostable , provider-agnostic

Then — "It's a prototype adidas can tune & adopt":

- **Tunable** scoring weights · improve **JD parsing** (adidas *owns* that data internally — we only scrape the public listings to compare)
- **Two adoption paths**: a **screening front-end** *before* the ATS · or a **talent-pool management backend** that **integrates with SAP SuccessFactors** (we complement it, never replace it)

You say:

"Against the state of the art, our edge is transparency and verification — most tools are opaque black boxes that trust self-reported language levels, and treat compliance as an afterthought; we built explainable scoring, real CEFR verification, and GDPR-aware data from the schema up. As a prototype, the scoring is tunable, and the job-description parsing would sharpen a lot internally — adidas owns that data, we only scrape the public listings. There are two ways to pick this up: as a screening front-end *before* SAP SuccessFactors, or as a candidate talent-pool backend that integrates with it. We complement the ATS — we don't replace it."

Closing line:

"In short: TalentHub turns raw CVs into a ranked, language-verified, fully auditable talent pool — and it's live in production today."

Screenshot shortlist (max 4)

1. **AI Interview screen** (Slide 4) — most impressive, teammate's work
2. **HR candidate ranking / Fit score** (Slide 5) — shows the intelligence
3. *(optional)* **Analytics dashboard** — polish & breadth
4. *(optional)* **Candidate profile w/ interaction history** — shows the audit trail

Must-say checklist (don't leave the stage without these)

- Real numbers: **33 tables / 66 endpoints / 305 tests**
- Transparent/deterministic scoring, **not** black-box; **humans decide**
- **Two scores**: Quality vs Fit
- Data is **transversal across all HR users**
- AI interview = **first screening + extra HR signal + borderline engagement** (improvement tracks not fully done)
- **GDPR deletion-aware + audit trail** (strong to say *at* adidas)
- **Provider-agnostic / self-hostable** AI

- Prototype → complements **SAP SuccessFactors** as a **screening front-end** *or* a **talent-pool backend**
- Credit your teammate for the **AI Interviewer**
- It's **live in production** on Vercel
